Methods of attacking Mobiles Devices

VOICE PHISHING

Telephone scam in which the attacker pretends to be someone you know, such as a bank representative, to obtain confidential information. Always remember to verify if the person is who they say they are.

MESSAGING

Attackers use services and apps to send messages with links that could infect your phone with data-stealing malware, never click on links sent to you until you verify the source.
QR CODES

Scanning a malicious QR code can be as dangerous as opening a phishing link in an email or text message. Always verify the authenticity of the person asking you to scan it and in physical QR do not forget to check that it does not have a stamp above the image.

APPLICATIONS

The most popular app stores have security processes to prevent malicious apps, but thousands of them sneak into mobile devices, to prevent this from happening you can check the reviews and check that the app you install is the correct one and not a fake.
