

The dark side of your

Connected Devices

Default passwords

Many devices retain the same key they came with from the factory.

Updates pending

The lack of patches leaves vulnerabilities open that can put your equipment at risk.

Lack of proper authentication

There are devices that allow access without verifying the user.

Exposure to automated attacks

Bots can scan 24/7 looking for weak devices.

Lack of monitoring

Many devices do not generate enough alerts or logs.

Privacy compromised

Some devices can listen, record, or monitor you all the time without your permission.

REMEMBER:

**A connected device is a gateway:
Make sure it is closed and secure.**
